
A
All 182 runs inside the 1e-4 tolerance; the largest difference is 53-fold below it; 100 exactly 0 (93 of them nucleotide)
runs
bit-identical (n = 100)
tolerance 1e-4
relative log-likelihood difference |ΔlogL| / |logL|
B
Absolute difference grows with magnitude, consistent with floating-point rounding (82 non-identical runs)
amino acid
nucleotide
gate failure (support)
absolute difference
|log-likelihood|
C
165 of 182 runs identical; worst 6.0 (2.0 excluding the gate-failure cell)
every topology identical: RF = 0 in 182 of 182
gate tolerance 5 points
the one gate failure (fails on support only)
runs (log)
max UFBoot support difference over shared splits (points)
